

ORBi-TEL⁷

Mobile Device Analytics Voice & Data Cost & Usage Module

Mobile devices including Tablets and Smart phones can now be managed by ORBi-TEL⁷ to pro actively report on both voice and data usage. The drive for increased productivity and remote working has led to a dramatic rise in the use of Tablets and Smart Phones for business. However visibility of the usage of these devices has been time consuming and any productivity gains seen by the users have been offset by increased administration overhead.

ORBi-TEL⁷ now makes monitoring of these devices simple and takes away the administration problem. This newly developed reporting module provides instant visibility of high voice and data usage based on user defined thresholds.

Reports are available under the following headings with various filter and sort options available.

- Mobile Usage
- Mobile Detail
- Mobile Summary
- Country of Origin Detail
- Country of Origin Summary
- Distributed Mobile Usage
- Account code

Your Mobile service provider simply supplies call records on CD or delivered direct to ORBi-TEL⁷ server for processing. A simple click of an icon on your desktop starts the load process with device data allocated to appropriate device within the organisational structure (database).

This optional module licensed module is compatible with ORBi-TEL⁷ release 18.4 and above.

Contact your Account Manager for further details.
